

HIGH-RESOLUTION HLA TISSUE TYPING REPORT (NEXT-GENERATION SEQUENCING)

Patient Name:	Ananya Sharma	Date of Exam:	September 14, 2026
MRN / Patient ID:	APL-BMT-2026-0914	Age / Gender:	28 Yrs / Female
Blood Group & Rh:	B+ (Rh Positive)	Referring Doctor:	Dr. Jose M. Easow, MD, DM (BMT)
Clinical Diagnosis:	Acute Myeloid Leukemia in CR1 (AML-CR1)	Specimen / Source:	Peripheral Blood (ACD-A / EDTA)

Locus	Allele 1 Call	Allele 2 Call	Resolution	Status
HLA-A*	02:01:01G	24:02:01G	High (NGS)	Resolved (2/2)
HLA-B*	40:01:01G	51:01:01G	High (NGS)	Resolved (2/2)
HLA-C*	07:02:01G	14:02:01G	High (NGS)	Resolved (2/2)
HLA-DRB1*	15:01:01G	04:03:01G	High (NGS)	Resolved (2/2)
HLA-DQB1*	06:02:01G	03:02:01G	High (NGS)	Resolved (2/2)
HLA-DPB1*	04:01:01G	02:01:02G	High (NGS)	Resolved (T-Cell Match)

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- High-resolution 6-loci (12-allele) HLA typing confirmed via Illumina NextSeq 550Dx NGS platform.
- Panel Reactive Antibody (PRA) Class I: 0%, Class II: 0%. Negative for donor-specific HLA antibodies (DSA).
- Haplotype shows favorable matching frequency in DATRI and NMDP unrelated donor registries.
- Recommendation: Initiate matched unrelated donor (MUD) search; verify biological sibling typing concurrently.
