

PERIPHERAL BLOOD STEM CELL (PBSC) HARVEST & CD34+ ENUMERATION REPORT

Patient Name:	Rohan Deshmukh	Date of Exam:	September 14, 2026
MRN / Patient ID:	TMC-BMT-2026-4412	Age / Gender:	34 Yrs / Male
Blood Group & Rh:	O+ (Rh Positive)	Referring Doctor:	Dr. Navin Khattry, MD, DM (BMT)
Clinical Diagnosis:	Relapsed Hodgkin Lymphoma	Specimen / Source:	Autologous Leukoapheresis Product

Parameter	Measured Value	Target Threshold	Unit	Clinical Interpretation
Total Product Volume	248.0	180.0 - 300.0	mL	Optimal Collection Volume
Total Nucleated Cells (TNC)	7.84 x10^10	> 4.0 x10^10	cells	High Cell Cellularity
CD34+ Absolute Count	2,840	> 1,000	/mcL	Robust Stem Cell Dose
CD34+ Cell Dose / kg	6.42 x10^6	> 5.0 x10^6	cells/kg	Single Harvest Target Met
Cell Viability (7-AAD)	97.4	>= 70.0	%	Excellent Pre-Freeze Viability
Sterility & Mycoplasma	Negative	Negative	Assay	Cleared for Cryopreservation

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- PBSC harvest target dose of >= 5.0 x10^6 CD34+ cells/kg achieved in Day 1 single apheresis session.
- Graft cryopreserved in 10% DMSO and 4% human serum albumin with automated controlled-rate freezer.
- Stored in liquid nitrogen vapor phase tank #3 (Canister B, Rack 4, Box 2) at -186 deg C.
- Recommendation: Patient cleared for high-dose BEAM conditioning chemotherapy regimen.
