

BONE MARROW ASPIRATE, BIOPSY & CYTOGENETICS REMISSION EVALUATION

|                     |                                             |                    |                                                     |
|---------------------|---------------------------------------------|--------------------|-----------------------------------------------------|
| Patient Name:       | Kavita Pillai                               | Date of Exam:      | September 14, 2026                                  |
| MRN / Patient ID:   | CMC-HEM-2026-7890                           | Age / Gender:      | 42 Yrs / Female                                     |
| Blood Group & Rh:   | A+ (Rh Positive)                            | Referring Doctor:  | Dr. Biju George, MD, DM (Haematology)               |
| Clinical Diagnosis: | B-Cell Acute Lymphoblastic Leukemia (B-ALL) | Specimen / Source: | Bone Marrow Aspirate & Posterior Iliac Crest Biopsy |

| Assessment                | Observed Result     | Reference Range | Unit       | Diagnostic Conclusion          |
|---------------------------|---------------------|-----------------|------------|--------------------------------|
| Marrow Cellularity        | Normocellular (45%) | 40 - 60         | %          | Adequate Hematopoiesis         |
| Myeloblast / Lymphoblast  | 1.8                 | < 5.0           | %          | Complete Morphologic Remission |
| Myeloid : Erythroid Ratio | 2.8 : 1             | 2:1 - 4:1       | Ratio      | Balanced Trilineage Production |
| Megakaryocytes            | Adequate & Normal   | Adequate        | Microscopy | Normal Platelet Budding        |
| Cytogenetic Karyotype     | 46,XX [20]          | 46,XX Normal    | Metaphases | Normal Female Karyotype        |
| BCR-ABL1 FISH Probe       | Negative (0.00%)    | < 1.0           | %          | No Philadelphia Chromosome     |

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- Bone marrow aspirate demonstrates Complete Morphological Remission (CR1) with < 2% blasts.
- Cytogenetic study reveals normal 46,XX karyotype in all 20 analyzed G-banded metaphases.
- FISH negative for t(9;22) BCR-ABL1 and t(4;11) KMT2A translocations.
- Recommendation: Proceed with planned allogeneic donor consolidation protocol.
