

COMPREHENSIVE COAGULATION PANEL & D-DIMER ASSESSMENT

Patient Name:	Tanvi Kapoor	Date of Exam:	September 14, 2026
MRN / Patient ID:	SGRH-HEM-2026-9921	Age / Gender:	37 Yrs / Female
Blood Group & Rh:	O+ (Rh Positive)	Referring Doctor:	Dr. S. P. Yadav, MD (Hematology)
Clinical Diagnosis:	Acute Promyelocytic Leukemia (APL / AML M3)	Specimen / Source:	Citrated Plasma (Light Blue Top 3.2%)

Coagulation Parameter	Patient Result	Reference Interval	Unit	Interpretation
Prothrombin Time (PT)	13.4	11.0 - 14.5	seconds	Normal Extrinsic Pathway
INR (International Ratio)	1.08	0.85 - 1.20	Ratio	Normal Hemostasis
APTT (Partial Thromboplastin)	31.2	26.0 - 36.0	seconds	Normal Intrinsic Pathway
Fibrinogen (Clauss Method)	284.0	200.0 - 400.0	mg/dL	Adequate Clotting Substrate
D-Dimer Quantitative	0.42	< 0.50	mcg/mL FEU	Normal (No Active DIC)
Thrombin Time	15.2	14.0 - 18.0	seconds	Normal Final Clotting Step

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- Coagulation profile confirms resolution of initial consumptive coagulopathy following ATRA therapy. - Normal plasma fibrinogen (284 mg/dL) and non-elevated D-Dimer (< 0.50 mcg/mL) confirm absence of DIC. - Recommendation: Safe for central venous line placement or bone marrow aspirate.
