

SERUM PROTEIN ELECTROPHORESIS (SPEP) & CAPILLARY IMMUNOFIXATION

Patient Name:	Harish Chandra Joshi	Date of Exam:	September 14, 2026
MRN / Patient ID:	MAX-ONC-2026-3810	Age / Gender:	61 Yrs / Male
Blood Group & Rh:	A+ (Rh Positive)	Referring Doctor:	Dr. Rayaz Ahmed, MD, DM (BMT & Hematology)
Clinical Diagnosis:	IgG Kappa Multiple Myeloma (Post-VRd Evaluation)	Specimen / Source:	Serum (Clot Activator Red Top)

Fraction Parameter	Relative %	Absolute Conc	Reference Interval	Abnormality
Total Serum Protein	100.0 %	6.8 g/dL	6.0 - 8.3 g/dL	Normal Total Protein
Serum Albumin	58.2 %	3.96 g/dL	3.50 - 5.00 g/dL	Normal Albumin
Alpha-1 Globulin	3.8 %	0.26 g/dL	0.15 - 0.40 g/dL	Normal Acute Phase
Alpha-2 Globulin	10.4 %	0.71 g/dL	0.60 - 1.00 g/dL	Normal Alpha-2
Beta Globulin	12.6 %	0.86 g/dL	0.70 - 1.20 g/dL	Normal Transferrin/C3
Gamma Globulin (M-Spike)	15.0 %	0.18 g/dL (M)	0.70 - 1.60 g/dL	M-Band Residual (0.18 g/dL)

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- Capillary electrophoresis reveals a small residual monoclonal M-band measuring 0.18 g/dL in gamma zone.
- Immunofixation confirms residual IgG Kappa restriction (down from baseline 3.42 g/dL - > 90% reduction).
- Free Kappa/Lambda Light Chain Ratio: 1.48 (Reference range: 0.26 - 1.65 - Normalized).
- Recommendation: Very Good Partial Response (VGPR) confirmed; proceed with autologous stem cell harvest.
