

BCR-ABL1 (MAJOR E13A2/E14A2) QUANTITATIVE RT-PCR (INTERNATIONAL SCALE %)

Patient Name:	Suresh Nair	Date of Exam:	September 14, 2026
MRN / Patient ID:	LAL-MOL-2026-7789	Age / Gender:	44 Yrs / Male
Blood Group & Rh:	O+ (Rh Positive)	Referring Doctor:	Dr. M. B. Agarwal, MD (Hematologist)
Clinical Diagnosis:	Chronic Myeloid Leukemia (CML-CP) on Dasatinib Maintenance	Specimen / Source:	Peripheral Blood (K2-EDTA 10 mL)

Molecular Target	Copy Number	Control Gene (ABL1)	BCR-ABL1 / ABL1 %	International Scale (IS %)
BCR-ABL1 Major (p210)	12 Copies	148,000 Copies	0.0081 %	0.0068 % (IS)
Log Reduction Level	4.17 Log Reduction	Baseline Standard	MR4.0 Milestone	Deep Molecular Response
Assay Analytical LOD	>= 100,000 ABL1	Valid Assay	Sensitivity: 4.5 Log	Passed Quality Control
Transcript Isoform	e14a2 (b3a2)	Confirmed Peak	Sequencing Validated	Major Breakpoint
ABL1 Kinase Mutation	No Mutation Detected	< 5% Detection Limit	Sanger / Direct PCR	Sensitive to TKI

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- BCR-ABL1 transcript level is 0.0068% on the International Scale, confirming Deep Molecular Response (MR4.0).
- Represents a > 4.1-log reduction in leukemic transcript burden from standardized baseline.
- High control gene transcript count (148,000 ABL1 copies) confirms robust molecular assay sensitivity.
- Recommendation: Continue current daily Dasatinib 100 mg regimen; re-evaluate molecular response in 6 months.
