

INVASIVE FUNGAL INFECTION SURVEILLANCE PANEL (GALACTOMANNAN & 1,3-BETA-D-GLUCAN)

Patient Name:	Harbhajan Brar	Date of Exam:	September 14, 2026
MRN / Patient ID:	PGI-HEM-2026-5502	Age / Gender:	46 Yrs / Male
Blood Group & Rh:	B+ (Rh Positive)	Referring Doctor:	Dr. Pankaj Malhotra, MD, FRCP (Clinical Hematology)
Clinical Diagnosis:	Febrile Neutropenia Post-Consolidation Chemotherapy	Specimen / Source:	Serum (Sterile SST Red Top)

Fungal Biomarker	Test Method	Observed Index / Value	Cutoff Threshold	Clinical Significance
Serum Galactomannan	Bio-Rad Platelia EIA	0.24 ODI	>= 0.50 Positive	Negative (No Invasive Aspergillosis)
1,3-Beta-D-Glucan (Fungitell)	Turbidimetric Assay	38.0 pg/mL	>= 80.0 Positive	Negative (No Invasive Mycosis)
Candida IgM Antibody	ELISA	0.18 Index	< 0.90 Negative	Negative for Invasive Candidiasis
Blood Aerobic Fungal Culture	Automated BacT/Alert	No Growth (Day 5)	Sterile 14 Days	Zero Fungal Fungemia
Serum Procalcitonin	CLIA Assay	0.12 ng/mL	< 0.25 Normal	Zero Active Systemic Sepsis

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- Serum Galactomannan index is 0.24 ODI (negative < 0.50), ruling out invasive pulmonary aspergillosis.
- 1,3-Beta-D-Glucan is 38 pg/mL (negative < 80 pg/mL), ruling out deep-seated invasive fungal infection.
- Blood fungal cultures exhibit no fungal growth at 5 days of automated incubation.
- Recommendation: Continue prophylactic oral Posaconazole; de-escalate empirical intravenous antifungal therapy.
