Barcode: KOSH*0914*88027

SERUM FERRITIN & IRON OVERLOAD PANEL (POST-TRANSFUSION HEMOSIDEROSIS)

Patient Name:	Clinical Patient #27 (Verified Cohort)	Date of Exam:	September 14, 2026
MRN / Patient ID:	KOSH-BMT-2026-1027	Age / Gender:	47 Yrs / Male
Blood Group & Rh:	AB+	Referring Doctor:	Dr. Ramesh Sarin, MD, DM (Hemato-Oncology)
Clinical Diagnosis:	Hematologic Malignancy Protocol Assessment #27	Specimen / Source:	Serum SST

Test / Assay Target	Observed Value	Reference Range	Method / Assay	Status / Interpretation
Serum Ferritin	1,420 ng/mL	20 - 250	Chemiluminescence	Elevated Iron Stores
Serum Iron	168 mcg/dL	60 - 170	Colorimetric	Normal Serum Iron
Total Iron Binding Capacity	240 mcg/dL	250 - 450	Colorimetric	Low-Normal TIBC
Transferrin Saturation	70.0 %	20.0 - 50.0	Calculated %	High Transferrin Saturation
Liver MRI T2* Concordance	Moderate Hepatic Iron	Normal Iron	R2* Relaxometry	Ferritin Correlated

CLINICAL INTERPRETATION & RECOMMENDATIONS:

- Elevated ferritin (1,420 ng/mL) and transferrin saturation (70%) reflect secondary transfusion hemosiderosis.
- Recommendation: Initiate oral iron chelation therapy once engraftment is stabilized.
- All assay analytical internal and external controls passed standard quality criteria.
- Report electronically signed and validated under NABL laboratory oversight protocols.
